METHODOLOGY:

OPIS Temperature Correction Assessment is based on previous day's ambient weather and pricing data.

Specifically:

- OPIS uses the average between the previous day's high and low temperatures
- Weather data comes from weather stations at airports nearest the temperature correction assessed city
- In all cases, the airports are within 30 miles of the terminal
- The previous day's price data sourced is the OPIS Gross Contract Average
- The volume correction factor used is based on product gravity at 60 degrees
- $OPIS \text{ Temperature Correction Assessment (TCA)} = \text{Volume Correction Factor} * \text{Contract Average Price of Product in cents/gal} * (60^{\circ} F - \text{Average Temperature})$
- Reports are available Monday through Saturday at 9:00 am
- All northern cities are currently included on the .pdf version of the report, specific cities may be selected in the .csv format or on custom formats
- The OPIS Temperature Correction Assessment is a proxy for the expected cpg cost of correcting the price based on the volume of product dispensed

For complete OPIS methodology, please visit <http://www.opisnet.com/about/methodology.aspx>.
